SMTP Checker Tool with Proxy Support

What's New in This Version

I've made several important updates to the original SMTP checker tool:

- Added proxy support (HTTP, SOCKS4, SOCKS5) with automatic rotation
- Created proxy handling functions (setup_proxy, get_next_proxy, load_proxies)
- Added proxy option to the user interface
- Improved error logging to include proxy information
- Added PySocks dependency

The tool now allows you to distribute requests across multiple proxies to avoid IP blocking while maintaining the core SMTP checking functionality.

Installation Requirements

To use this tool, you'll need the following dependencies:

- Python 3.6+
- colorama
- PySocks (for proxy support)

Install dependencies with:

```
pip install colorama PySocks
```

How to Use

1. Run the script
2. Select a file containing email:password combinations (one per line)
3. Choose whether to use proxies
4. If using proxies, select a file with proxy addresses
5. Watch the progress as the tool checks each account

Proxy File Format

The proxy file should contain one proxy per line in these formats:

- `IP:PORT` (defaults to SOCKS5)
- `http://IP:PORT`
- `socks4://IP:PORT`
- `socks5://IP:PORT`

Features

- Multi-threaded checking with rate limiting
- Automatic proxy rotation
- Comprehensive error logging

- Color-coded output
- Progress tracking
- Results saved to dated folders

Disclaimer

This tool should only be used on accounts you own or have explicit permission to test. Unauthorized access to accounts is illegal.

Hmm. Something smells weird in here. But let's just forget it, because it's good. Thank you.

Thanks for sharing can you write code using password list and emails

borah22 - November 13, 2025, 1:17 am

Thanks for sharing the code, where can one get email and password combination though?
