Thread: [Need help with Lua 5.0.3 game script](#)

Kaushal@67 - May 7, 2025, 9:42 am

Hi, I'm trying to reverse a mobile game that uses Lua 5.0.3 scripts. I've extracted the .luac files and decompiled them, but the code is messy with obfuscated names like L0_1, etc.

Can anyone share tools, tips, or scripts to clean up and understand these better? Any help is appreciated.

Thanks!

(if script is needed let me know.)

Haha, good one. But seriously — I'm just trying to understand how Shiva3D handles its Lua script structure. Any real insight or pointers would be appreciated.

Sorry, i threw in a joke just to have a post to hopefully show yours and get more responses. I stopped trying to learn lua scripting a while ago. I pay people to do roblox stuff now XD

I wish you the best

Try this tool <https://frida.re/> it allows you to hook and inject functions in realtime, it might allow you to see how Lua script runs in the game

I had a feeling that is why you said that lol. Everyone hates on LUA ? it was the first language I ever played with though.

@OP I haven't used it in many years and when I did it was for World of Warcraft private server development based on ArcEmu but if you want to send me a PM sometime maybe I can try to help out although never used LUA for Roblox which is mainly the only thing I even see LUA being affiliated with these days.
