??? MACSpooF Pro – Advanced Interface-Level MAC Address Spoofer
Smarter spoofing. Smarter OPSEC.

Offering FREE Vouch Copies – DM me

? Description:

Forget macchanger. It's basic, outdated, and doesn't spoof realistically. MACSpooF Pro is a next-generation Python-based CLI utility that:

- ? Generates highly realistic MAC addresses
- ? Uses real OUI vendor blocks (Apple, Dell, Lenovo, Android, and more)
- ? Follows IEEE formatting rules (Unicast, Globally Unique)
- ? Automatically backs up and restores your original MAC
- ? Works across Ethernet & Wi-Fi interfaces with ease
- ? Clean terminal interface — no garbage output, no guesswork

Coming Soon: Full rewrite in C for high-speed spoofing + stealth mode.

? Features:

- Interface Selector: Choose which NIC to spoof (e.g., wlan0, eth0)
- Vendor Spoofing:
 - Apple, Dell, HP, Lenovo
 - Android Devices
 - Linux-based systems
- Realistic Device ID:
 - Last 3 bytes (device ID) generated via normal distribution to simulate vendor assignment randomness
- Standards-Compliant Addressing:
 - Bit 0 = 0 -> Ensures Unicast
 - Bit 1 = 0 -> Ensures Globally Unique (not locally administered or randomized trash)
- Backup & Restore:
 - Automatically backs up your real MAC
 - Option to revert at any time

Built for privacy, audit evasion, pen testing, or simply staying under the radar.

? Price:

\$5 flat

Payments Accepted: Bitcoin (BTC) and Ethereum (ETH) only

What's Included:

- ? Full Python source code
- ? Step-by-step usage tutorial
- ? Lifetime updates for the Python version
- ? C version access when released (if purchased before release)
- ? Access to future updates and feature implementation

? Requirements:

- Linux OS (any modern distro)
- Python 3.x
- Root (sudo) access

? Contact Me:

Code Forum PM (preferred)

Escrow Accepted for Serious Buyers.

No refunds after delivery

Price of a coffee, power of a real spoof.

MACSpoof Pro – not just a tool, a necessity.

How does this compare to free open source tools such as [macchanger](#)?

DramaKing - June 6, 2025, 6:38 am

You're going to charge \$10 for a script that does what macchanger can do for free just because it has an algorithm to create more 'natural' MAC Addresses? And what even is a Unicast MAC address? Plus, you're really going to tout backing up permanent MAC addresses as a 'feature?'

Unicast tells Layer 2 that the Mac address is intended for only 1 specific user. Setting Bit 0 to 1 would make it multicast. Additionally backing up the Mac allows for ease of reverting back without needing to reboot your computer. I can give you a vouch copy if you want. No one is forcing you to hate, have you read what the opensource macchanger program actually does? MacChanger is also outdated and not maintained.

I have no idea what is inside that tools source code nor do I care to look. If you trust any open

source tool without reading the source code that's on you. What does the macchanger source code do? If you can't determine that yourself it's not my job to do it for you. I can offer you a free vouch copy if you want and test it out yourself. MacChanger is also outdated and not maintained

Yes, macchanger is free — and outdated. This tool goes further: it generates realistic MACs using vendor-specific OUIs and normal distribution for device bytes, respects IEEE-compliant unicast/global address formatting, backs up and restores the original MAC, and gives a clean, usable CLI interface — all for the price of a coffee. If you're the kind of person who just wants a random MAC, use macchanger. But if you want spoofing that actually looks real under scrutiny, \$5 is more than fair for the level of detail

Sure, let's not trust something endorsed by even GNU (<http://www.gnu.org/software/macchanger>) and instead trust (And pay) some random member with 0 reputation on a hacking forum.

No offense to you, and what you've built, if it's a fully functional tool, then it is probably better than something that hasn't been updated in 12 years. But if you're trying to say that you can't trust it because it's "only" open source, then we absolutely shouldn't trust anything you provide, and definitely shouldn't pay for it.

Like I said I'll give you a vouch copy but you couldn't even read the source code to understand what it's doing. You asked me what an open source tool does when it's not even maintained and outdated. You can't help uneducated stupid.

couldn't even read the source code to understand what its doing. You asked me what an open source tool does when its not even maintained and outdated. You cant help uneducated stupid. To be clear, I asked why anyone should pay for your tool compared to something that is freely available online. I never asked you to explain what it does or how it works. You made several assumptions based on zero evidence and decided to take the path of condescension.

I'd revise your statement, you cannot help those unwilling to be helped.
Good luck with sales.

If you just commented on my thread to hate that's on you. You never took a look at my product even when I offered a free vouch copy. Whether anyone decides to purchase my product it doesn't effect me. I am offering a product that's more legit and more solid than the majority of the stuff that gets sold on this forum. Most of yall donate to rep each other and circle jerk your own low quality products and services. When you offer a high quality product and know your own value you don't get on your knees. Only people who are desperate for sales and have low quality products do that.
