Thread: [Send Anonymous \(Spoofed\) Emails For Educational Purposes](#)

Auth Code - June 5, 2025, 10:39 pm

Disclaimer:

This post is for educational purposes only. Sending spoofed or anonymous emails can be illegal or unethical if used for harassment, fraud, or without consent. Always comply with your country's laws and only use this knowledge for ethical testing or with explicit permission.

What is Email Spoofing?

Email spoofing is the process of sending emails with a forged sender address. This can be used for testing, privacy, or internal system notifications, but can also be abused—so always act responsibly.

Simple PHP Method to Send Spoofed Emails

You can send emails with a custom "From" address using PHP's mail() function. Here's a basic example:

```
Code <?php
$to      = "recipient@example.com";
$subject = "Anonymous Message";
$message = "This is an anonymous email sent for educational purposes.";
$headers = "From: Spoofed Name <spoofed@example.com>\r\n";
$headers .= "Reply-To: spoofed@example.com\r\n";
$headers .= "X-Mailer: PHP/" . phpversion();

if(mail($to, $subject, $message, $headers)) {
    echo "Email sent!";
} else {
    echo "Sending failed.";
}
?>
```

Instructions:

Save this code as spoof_email.php on a server with PHP and mail() enabled.

Replace the \$to and \$headers values with your target and sender addresses.

Run the script.

Notes & Limitations

Many email providers (like Gmail, Outlook, etc.) filter or flag spoofed emails. Your message may go to spam or be blocked.

This does not guarantee inbox delivery, especially for major email services.

For more advanced sending (with authentication, HTML, etc.), use SMTP libraries like PHPMailer or Python's smtplib.

Never use this for phishing, fraud, or any malicious activity.

Thanks.
