Thread: [Website Typescript front end/design + SpringBoot backend api React/Node](#)

Mxstermind - June 10, 2025, 9:26 am

- 1) Website Typescript front end/design + SpringBoot backend api
- 2) React/Node
- 3) We need our current website updated and modernized to add new features, currently it's <https://curve.rip> we need to modernize the design, add login system, add features for staff like changing stats, modifying punishments, improving profiles. Similar to pvp gym.net , veltpvp.com , minemen.club.
- 4) Full stack development, the backend spring boot application already has a bunch of endpoints but may need improving further.
- 5) Around a month
- 6) Yes we, <https://curve.rip> is fully built and in production, also the mainframe/api is in production and fully built already, it'd be improving the design + adding the new stuff.
- 7) I don't think so.
- 8) I would need to get some quotes from you guys and some options say: We can do it in a month for X price, 2 weeks for Y price.
- 9) Web and Mobile compatible, all via a website no app required.
- 10) It's in production so obviously security & production ready, our current systems are already optimized so it'd be following the same structure.

SpringBoot is Java right? But you also mention Node, which is backend JavaScript?

I can work with it all, except SpringBoot, so if that's somewhat simple or to my misunderstanding not in Java, then I can help.

Sadly I'm out of office the next few weeks on vacation.

But if everything fails, feel free to hit me up later.

Best wishes, and hope you get it done before I'm back ?
