I never want to be convinced that freely available tools will penetrate a large and well-protected platform or device. These tools were currently useful in 1999, but now they rarely work. There is a hacker who can do anything in a few minutes. Do I have the right to what I said?

DramaKing - June 24, 2025, 4:57 am

Absolutely not. Even the best hackers are patient. They specialize, and if they do breach a system quickly, they got lucky.

P??sonl?af - June 24, 2025, 5:00 am

While many people think hacking is just opening CMD and running some commands or opening Hack.exe, it actually req. a lot of testing/recon & knowledge. Getting into a well protected network or system usually takes days or even weeks. Trying different methods or scouting for vulnerabilities.

I exaggerated a bit when I said in minutes I know, but what I wanted to say is that the freely available tools only help in initial examinations.

I'm just trying to be as professional as possible at exploiting it, but I think the freely available tools are not helpful for major breaches.

well u said it quite right, why would any very good tools be given out to the public? They would instantly be removed, your best bet is to either buy some expensive ones from people you can trust, or program ur own stuff. (in my opinion correct me if i am wrong)

If you're talking about cain and able tools of yester-year then yeah.

yeh What do you think are the best paid tools that fit this trend in your point ?

Can you guide me in terms of programming special programs? Do you have experience in this regard?
