Thread: [Help with breaking into phone](#)

Zorvixen34 - July 8, 2025, 7:49 am

Hi, I have an unusual issue. I need some help. I am 18 years old. My father is probably cheating on my mother. My mother is on the verge of a mental breakdown because she feels what is happening and at the same time there is no evidence of it.

I need help trying to hack into his phone to get evidence in the form of messages, etc. I specifically installed kali linux for this, I tried to do something myself but I do not have enough knowledge. I would be grateful if someone would suggest me a solution. The phone is a Samsung Galaxy a71, probably currently running android 12 or 13. It is on the same local network. I also have direct access to it sometimes, but I don't know the lock screen password so I can't do anything. The best solution would be to somehow crack the lock screen password and upload some software that would be a keylogger and most preferably allow me to take screenshots remotely and send them directly to my laptop. Is there any way to do this? Thank you in advance.

Cracking the lock screen password is going to cost an astronomical amount of money if at all. Samsung is no slouch when it comes to building secure devices, especially with Qualcomm chips.

Kali Linux will not help you, although if you're really lucky and can learn to use it, you might be able to find something with dnschef. I also made a thread on PIN cracking.

<https://hackforums.net/showthread.php?tid=6288335>

You can also buy an O.MG cable (or its new, much cheaper knockoff) and switch it with your father's charging cable. Trigger a payload right when it gets set down and before the screen locks. You might just perform the first recorded instance of juice jacking.

Zorvixen34 - July 15, 2025, 2:27 am

Could you tell me what I can do with O.MG cable? Maybe something like HID sniffing? What can I do with dnschef? Can you give me some ready-made scenarios on how I can do this?
