How to avoid getting caught and stay anonymous when trading

Use Tor or I2P, VPN and anonymous cryptocurrencies (Monero) to work with darknet marketplaces.

Never use personal data and keep separate mailboxes.

Trust only sellers with a good reputation and be sure to use escrow systems for transactions.

Regularly update OPSEC and monitor new tracking methods.

1. Only use Monero when purchasing on darkweb markets.
2. Never use any resemblance to your personal identity on darkweb when creating usernames/passwords (should be applied for surfaceweb too).
3. Tutamail(email)/XOR(communication/email)/Jabber(communication (only using PGP))
4. Use escrow no matter the seller. Trusted sellers scam too and are more likely to get away with it.
5. Oh, use USB booted Tails for OS.
6. ALWAYS PGP ENCRYPT YOUR PERSONAL MESSAGES.
7. Read 6 again.
8. Keep cold storage backups of any keys/seeds in a hidden encrypted partition using any software like VeraCrypt and make sure your password is at least 20 characters on the container.
9. Password manager on same cold storage device.
10. Everyone is LE if they're pushed hard enough.
