to look for page with content like /login.php admin.php

go on githum.com/ and add this after the / DV64/Find-The-Admin-Panel

you can also search for Gdork github, it give a lot of great query ;)

There are many automatic and fuzzing tools which you can use to find admin panels.

you can use DireBuster for path brute forcing and Sublist3er for subdomain brute , you can also make tool to scrap all html tags to look for admin , but not always you will find admin page as there are web masters that use FTP / Hosting panels

Bshol - August 13, 2025, 1:11 am

There are many automatic tools to find admin panels built in Python in the Github. Based on my experience, their success rate is less than 30 or 40%. Before using them, I always check logs and then try to find manually. (Inspecting the image, Googling, etc.)

Automatic tools will go as the last method only if all manual methods don't work.

There are a lot of automatic admin finder tools and scripts in the world. But the best way to find admin page is to think like an Admin or Administrator — they've only hidden the path, nothing more.

"Before relying on tools, use your mind first, and give it the time it needs to guide you better."

I read this text from this hack forum few days ago, and i love this text really~ ?

And yes, this is the best way to find admin pages. Most administrators are much cunning than we thought and any tools can't find those admin panel urls before you are thinking like an administrator.

Also, admin panel urls can be also thought as text so they are relied on languages. If your target country uses Portuguese then you must find Portuguese admin urls. For example, /administracao, /painel, /adm-controle etc...

Good luck in your hacking business and feel free to PM me when you need any discussion with me.

I am always here for you~ :)
