Thread: [Website DB exploitation](#)

darkguide - August 13, 2025, 4:29 am

Hello guys,

Recently ...2023 this game www.talismanonline.com that has a support page www.miragame.com was hacked. Hackers managed to access DB, prior to that it was hacked also, as you can check here <https://www.youtube.com/@prometheus847>(this guy did it and posted some vids).

I've lost over 3kUSD and the support won't do anything to recover my things online so I've been digging into the website, and I am in need for some guidance.

I've run Nikto scans, tried to reach their MySQL (unauthorized), nmap scans. ZAP scans with diverse flaws, looked for S3 buckets and I just can't find the path.

Would like to know if someone could help me so they pay for the damage they did, they're acting like mercenaries and my CC provider says they can't refund things because it's been too long.

Thanks in advance

Have you tried SQL mapping all their parameters and forms? I'd recommend running sqlmap on the POST request data you found on ZAP, forms with --forms (it's simple) and on parameters. Have you tried to perform web enumeration with gobuster and dirb for maximal results? If an admin page was found, consider brute forcing it and using sqlmap first.

Have you tried doing recon on their CMS (if they have one)? Have you tried further enumerating the gobuster results if the scans were done to find the versioning of the software used to find a possible exploit?

You can target other domains that are hosted on the same server with that platform.
