Thread: [Hidden embed URL links](#)

?inimalist - August 21, 2025, 1:16 pm

Good evening,

I don't know if this is the right section to write it, but I'm looking for a way to find how to get hidden video embed URL links from a website. I tried via inspect mode and view source code but no luck.

Is there a way to do this somehow?

Bshol - August 21, 2025, 1:36 pm

What's the source website of the video?

Check the Network tab in DevTools while the video is playing. You're usually looking for .m3u8 or .mpd requests (HLS/DASH manifests). That's where the real stream URLs are loaded, not in the page source. Tools like yt-dlp can also pull them directly.

You're trying to get the actual video URL that you're seeing on the website? If yes, there a few different ways to do this.. I can help you with this for free.. just send me a PM with a link to where the video is shown.

I already did this. After I try to search for .m3u8, the website refreshes automatically.

In that case, try capturing traffic outside the browser. Tools like mitmproxy, Fiddler, or even Wireshark will show the requests the player makes before the page refreshes. Often the .m3u8 or

segment URLs only appear for a few seconds, so recording the session helps. Once you have one of those links, you can play or download it directly.
