Thread: [Question: How do they hack Wi-Fi networks with the SSID?](#)

HideSucuri - August 21, 2025, 9:11 pm

Hello everyone, I have a small concern. A few days ago, while browsing the Facebook marketplace, I saw that some people were selling your neighbor's WiFi password. The only requirement is to download Wifi Analyzer and give them the SSID. I would like to know how these people manage to access these passwords from a distance, because I purchased the service for \$1 USD and they gave me three passwords, all of which connect perfectly.

You know that Facebook Marketplace is full of scams, right? This must be a country-specific thing because in the US, wireless security is taken much more seriously. Generating a password from a default ESSID stopped being possible years ago. Generating a password from a personalized ESSID is no more possible than a password anywhere else.
