Thread: [Search users using Email over the Web + Vulnerability Detection Tool and Challenges](#)

Squixey - August 31, 2025, 9:14 pm

I have been friends with them for quite a long time. Thought to share some of their repos here with everyone.

First I wish to share their Doxing script, it's not much but it's very helpful if you are into Doxing or wish to find someone using their username or email .

Most of their dev works with beehive (beebeeto framework) so you can dig their repo if you wish to try out the beebeeto framework yourself.

1st Let me Introduce you to SREG (SEARCH REGISTRATION)

YOU CAN SEARCH HOW MANY PLATFORM A USER IS REGISTERED ON USING THEIR EMAIL, PHONE, USERNAME

LOOKUP COMES WITH USERNAME, EMAIL & PHONE, ANY STRING WORKS, YOU CAN LEARN ABOUT IT OVER THEIR GIT!

SREG - <https://GitHub.com/n0tr00t/Sreg>

2nd Let me Introduce you to BeeHive (Can be used to find Vulnerability, Exploits, Subsequent Attacks and such similar)

It's based on their Beebeeto Framework and you can use it to scan for Vulnerability over your targets and match found exploits if they work on the target and such similar.

BeeHive - <https://GitHub.com/n0tr00t/Beehive>

3rd I'll like to introduce you'll to their XSS (cross site scripting challenges)

n0js XSS Challenge - <https://GitHub.com/n0tr00t/n0js>

Their group official website doesn't work anymore but you can always use Archive.org Time machine to lookup the same and try doing the XSS Challenge if you feel like it.

Have a good day everyone, I have been in connection with many groups, most of their works are private but some of their works are public but still not recognised, so whenever I feel like it, I'll be posting some of these free time developments, you can have a good time enjoying and doing something with your time as well!

Don't forget to Like this post, as it will encourage me to share more of these stuff which been deep down hidden for a long time.

patchdev - September 4, 2025, 11:23 am

thanks for sharing this
