Thread: [Help bruteforcing a password hash? Im not sure where to start.](#)

NESOMA - September 10, 2025, 7:04 pm

I got a password hash (blowfish openbsd) and I've heard from friends that you could bruteforce it to decrypt it. Is there anywhere I can just pay someone to attempt to brute force it using password lists or like how do I do it myself, idk what I'm doing someone just told me to ask here.

So, download hashcat.

<https://hashcat.net/hashcat/>

Update your GPU drivers and any extra software hashcat recommends

Then navigate to the folder hashcat is in in cmd (cd \Downloads\hashcat)

Download some wordlists:

<https://weakpass.com/wordlists>

Drop them in the same folder as hashcat

then all you do is use some AI to identify the hash and write the hashcat command to crack it using the wordlist you downloaded, or bruteforce it, which requires no wordlist but can take hundreds of years depending on the hash algorithm and PW length.

You'll need scads of money for a true bruteforce of Blowfish. Dictionary attacks use wordlists. Still expensive.

The forum that you want is Hash Bounties under Market.

If you got a good GPU rig, you can use hashcat to make it work. I can also provide you a good hashcat cheatsheet if required.
