Thread: [Fud .NET Executable 0/72 Virustotal](#)

skyt__ - September 13, 2025, 6:38 pm

Hello Hack Forums,

Today I am discussing a method to get a fud .NET executable. The input executable does not matter whatsoever it will always be fully undetected. I'm quite puzzled as to what to do with this. I'm just looking for ideas on what to use it for because i dont really know what. Would a crypter with it be cool?

All help appreciated!

Little follow up here: I have a video demonstration using pulsar rat and uploading it to virustotal but since I am not upgraded I can't post videos here. Sorry :(

Convoy the link to me.

Oh, and your method is burned or should be in a week or so.

no matter how many times it gets uploaded to virustotal it will NEVER be detected. (Unless the method gets leaked and AVs catch on.

I'll take it as a compliment. It's really not that complex though. Not much coding involved.
