Thread: [Perseverance Rover Life Signs](#)

Prepper - September 18, 2025, 9:07 am

NASA Rover Perseverance has found potential signs of past life on Mars

"The rock is covered in patterns of "leopard spots" that may have formed through chemical reactions known to fuel life. On Earth, spots like these are often associated with the fossilized record of microbes. Though other explanations still remain, Perseverance scientists have now published a peer-reviewed paper that finds no particularly strong evidence for any of the alternatives studied."

My buddy was just showing me some info about this. Very exciting & I want to see more soon.

Lots of interesting theories about Mars, but from what we know, it once held water, it once had a more active atmosphere, and across time it is pretty plausible to believe that life could have formed.

I personally do not believe that life is exclusive to earth, and I do not think it is exclusive to our known history/timeline either.

Life is not super common, and I'm not saying there is or was life on Mars.
I would not be surprised to find out there was life there though.

This was a interesting thing.

If it is what the scientists think it is, its a pretty large and exciting step. Might be the only indication in our lifetime/century.

Either way though we all know Mars was a heavily populated planet. But there was a 2 way war between Earth and Mars against the no longer existing planet that is the asteroid belt. The pyramids were a part of a massive land cannon used to shoot massive energy beams. When the time came to absolutely destroy the third planet, it ripped past Mars (the massive trench you see now), destroying its atmosphere and all the life on it. Planet 3 was successfully destroyed.

The power pulled from the pyramids was so massive that it split Pangea into the continents we know today. Destroying current society at the time.

We have rebuilt now, we won the war. But at what cost. No one on Mars survived. We destroyed a planet and pressed the restart here.
