Thread: [How to stripped your metadata from your videos before posting](#)

cad-syak - September 22, 2025, 5:52 pm

On Windows/macOS

Use HandBrake (free) to re-encode the video -> strips metadata.

Or run exiftool -all= yourvideo.mp4 (removes all metadata).

On Android/iOS

Use apps like Video Converter, Metadata Remover, or Scrambled Exif (video supported).

Upload to social platforms

Some platforms (e.g., Twitter, Instagram, TikTok, Whatsapp) strip most metadata automatically, but don't rely on this. Always remove before uploading

Pro Tips

Screenshots: Taking a screenshot of a photo/video frame usually removes metadata.

Export/Resave: Exporting in a new format (e.g., from editing apps) often clears metadata.

Double-check: Use ExifTool or an online metadata viewer to confirm it's clean before posting.
