How Far Would You Go To Hide Data? Decentralised Corruption vs The New Internet

Combining the basic phone accessibility of USSD with the immutable, encrypted ledger of a blockchain creates a secure system that provides the highest level of data protection technology for low-stress, high-impact situations, such as election voting.

Voting through the blockchain.... sometimes technology does go too far. I think the old ways are better.

Fish - October 9, 2025, 2:49 am

Interesting concept. Marrying USSD with blockchain could bridge real accessibility gaps.

Vectura - October 9, 2025, 4:00 am

Really interesting concept — bringing blockchain-level security to something as accessible as USSD could be a real game changer for transparency.

Oh_Well - October 9, 2025, 4:27 am

It's interesting but also soooo difficult to completely hide data as technology progresses

You would be very surprised...

<https://hackforums.net/showthread.php?tid=6290512>

Trump was right about one thing - there is no way to validate a US election.

Unfortunately nobody cares

I agree. If it isn't broke, why fix it?

Like I said, the OLD ways are better. Get computers completely out of it. Hand counts, with 2-person integrity.

100% agreed

Digital counts need paper recounts too
