Thread: [Need Help w/ Botnet Setup for DDoS Attacks](#)

Vicckous - October 9, 2025, 11:37 am

Hi everyone,

I would really love if someone can enlighten me in DDoS attacks these days. I use to be a self proclaimed "King" of DDoS attacks YEARS ago. About 10+ years ago. I am now getting back into deeper Pentesting and I urgently need assistance in getting something setup ASAP.

Back in the day, I always knew of IRC and Botnets, but I did not get into them. I heard that Botnets were the best for DDoS attacks. Is this still true?

Me personally, I used a VPS offshore. I would get a VPS buy purchasing one, upload it to PuTTY with a good DDoS Perl SScript and I did my DDoS attacks this way through PuTTY.

My question is, does this method even still exist? Do people still DDoS by buying a VPS and using it for DDoS? I feel like no one really knows that method.

Anywho, is there anyone here who can help setup a Botnet for me? I will pay, we can get a contract going for the Botnet setup. But I need someone with TOUGH EXPERIENCE in DDoS'ing and Botnets. I am using the Botnet for the purpose to ONLY send DDoS attacks.

Very good pay \$ here. I want a very well trusted member in the community who can assist me in this. Please

Also I am not going to contact anyone through telegram or third party apps. Keep everything on site please.

Thank you guys!

PhillyStyle - October 9, 2025, 2:09 pm

I'm with you. I'm from the old school days of IRC bots. It appears now that they are using the decentralized P2P networks, but I don't know for sure. I'm guessing that they try to open a server connection on as many of the bots as they can with UPnP, but I don't know. I'm not a big fan of DDoS these days cuz it can get you into a lot of trouble, but I would like to know the methodology at work.

lovesinning - October 10, 2025, 7:31 am

Hey,

I have been in the DDoS community for a long time as well, 8+ years and the industry has changed alot. It's no longer simple to DDoS via layer 3/4 anymore as a bulletproof server with a perl script can only get you so far as its most likely a DoS script without spoofing the source ip address which is easy to mitigate and block as an attack.

Nowadays botnets are honestly very dead and its not really a thing anymore within the community besides C2's which run on API's, most people just purchase stressers API and link it to their C2's and start reselling.

The best thing you could do is get a spoofed server which has IPHM enabled which allows you to spoof your attack (modify the origin's attack source) which never reveals your servers ip address. This with a good script can get you a long way.

Let me know if you want to speak more upon this, I currently own a stresser without using other peoples power besides my own.

Dr4k0xKaRTeL - October 11, 2025, 8:45 am

I help with setups and installs. Check out my thread on the market place or my connect information on my profile if you need help with any services related to botnet setups or installs.

Thanks bro.

I honestly cannot believe it. Things have changed so much. I knew it was gonna happen, but man! I feel so old!

Do you recommend any sites or know where I can get a IPHM enabled server?

Its crazy bro. I mis the old days man! I want to learn how to DDoS fr, especially these days but of course for educational purposes only.

Take a look at https://spoofer.caida.org/recent_tests.php

There are many providers that accept IP Modification Header. But they are "hidden," and if you suspect that a particular ISP is spoofing, check it first on spoofer.caida.org.

Spoofing is not that difficult; it depends on how the ISP routes. In the past, most spoofing originated from Cogent's line. That's why HostSailor, Host.AG, Verdina, and all the others were spoofing. Colocrossing lol.

In the past, spoofing worked on Iomart. Even on OVH (I'm talking about 2014-2015), there were a lot of stressers hosted with the .ovh domain, and no one was "afraid." But since the vDos Stresser story... and a lot of stressers being shut down, in 2025 they ended up caring more about confidentiality with domains from Nicenic, Cnoblin, bulletproof hosting.

As for stressers, it's not something I recommend 100%. Some stressers are OK, but many run under "cover."

I can't disclose my hosting provider on here as this is more of a private matter and I wouldn't want the host getting leaked in any kind of way, thats how most spoofing/IPHM enabled providers stop spoofing due to upstream reports and such but be sure to message me if you are interested in learning more or have any further questions. Some providers do spoof but they often suspend your server due to the illegal DDoS, even if its used for educational purposes.

Hi bro, thanks for your response.

So do you also agree that using a VPS with IPHM is the best way to DDoS now in days?

lovesinning - October 17, 2025, 2:43 pm

Dedicated server would be preferred but for testing and smaller attacks then the answer would be "yes". A vps would be the smarter choice.

Thank you for helping bro!

Other choices as in what exactly? Ways to DDoS? I can sell you some servers that have IPHM enabled, if you need any proof then I'll be free to provide them.

Tyr - October 17, 2025, 8:33 pm

Whoever's hitting me rn needs a better load you got weak ass servers

Vicckous - October 17, 2025, 11:51 pm

Im possibly down to do this. Through a contract obviously. Probably what need a MM as well. Your account is way too new to send you any money for any types of services.

(Oct 17, 2025 08:33 PM)Tyr Wrote: [\[CITE\]](#) Whoever's hitting me rn needs a better load you got weak ass servers
LOL!

LOL!

Yea of course, I would even send the server before you send any funds.

Here is the thing though bro, after you give me the server, Im still not sure how to proper DDoS these days. Will you show me step by step? Yes, I will be paying you.

Yes of course I will show you, its honestly very simple as long as you have methods such as UDP,TCP scripts etc, I will provide some simple scripts and show you how to use them.

salmagama12021 - October 19, 2025, 9:44 am

good works thanks

RTwire - November 5, 2025, 11:09 am

How much does it usually run now days? money wise lol

Lapemrs - November 6, 2025, 4:10 am

You are very old school, perl scripts are too old haha

Nowadays a DDoS can be even be executed using proxies, botnets, and raw power from dedicated servers who allow spoofing (not every host allow this)

Send me a private message or convo with your telegram and I may be able to help you out.

tksexe - November 6, 2025, 11:04 am

@lovesinning I'm also interested, you can call me on Telegram.

@tksofc

Hello, can you give your current telegram account for communication? I want to order a service from you

iTzMenewb - November 8, 2025, 7:26 pm

alot has changed now jsut make sure you get a good vpn and clean everything out all the time

BrothaMike - November 10, 2025, 1:31 pm

Damn this makes me feel old too lol. I used to upload php shells on web servers and load em on a booter and start ddosing haha. Things changed a lot!!

Scarecrow - November 10, 2025, 1:51 pm

What are we aiming for? Layer 4 or Layer 7?

What's the goal? packets per seconds or output power?

Lot of that matters to direct you.

Layer 4 depends on target. Obviously raw attacks (from qbot variants) will work best, but very unstable. Spoofed attacks will be better if they work and more stable. Like I said though, it literally

ALL depends on the desired outcome.

if iy not too late, i could get you like 250k to 350k router access to get your own made exploit set on them never been used and will provide kickass power

Lapemrs - November 11, 2025, 12:18 pm

We can work on custom feature flood option on this one

<https://hackforums.net/showthread.php?tid=6313487>

If you are interested let me know and we can talk on telegram, I don't have any issue going first with trusted members.
