DIY Hak5 Shark Jack?!

I saw this on instagram and I thought it was pretty neat. It seems like its still strongly under development.

Github: KaliAssistant

But the Hak5 device allow you to remotly connect to it over your C2 (if you created one) very easily run script and create advanced script and with the C2 this is totally safe i mean no one can catch the connection and use it.

What do you mean by "totally safe"?

tje C2 from hak5 is setup by the "admin" of the server itself. Each pineapple, mk7, shark, ducky etc are manually added and allowed to access the c2 with the c2 settings! In other words someone cant just scan and randomly connect or bruteforce on the C2 and if you updated your device you should net be able to reset the device setitngs or do a factory reset to gain access to it! Users have full control of each devices/network of the c2.

I have never owned any hak5 devices but what about misconfigs?
