Here Are 10 Prompt Engineering Techniques to Transform Your Approach to AI

Extensive work with prompt engineering has transformed AI interactions through 10 key techniques: recursive expansion for automatic depth exploration, maximizing token windows (99.99% usage), applying DRY principles, internal monologue for transparency, 360-degree thinking for comprehensive analysis, ASCII visual aids, ultra-verbosity for detailed explanations, persona-based emulation, fact-checking to prevent hallucinations, and generating follow-up questions for deeper learning. These methods deliver higher quality outputs, fewer iterations, and greater control over AI responses.

People are paying around 50\$ for courses about prompt engineering , i think they should be all self taught , cause its a matter of perspective , but taking into consideration the basics ..

That's crazy... so many free resources. That's ridiculous.

GPT4-5 is very capable of teaching someone how to prompt better for its own system, or any other...

Can't believe people will pay \$50 for a course instead of \$20/mo for a service that can teach you everything, much faster, all day for 30 days.

Coding and prompting are becoming very similar.

It has always blown my mind how many people will pay for stuff like this when you can find it for free.
