What You Are Buying

Python Source Code
Detailed Build Instructions
Forum Thread Support
Full Software License / Owner (Lifetime)

The Python script stub.py starts hash checking functionality to determine estimated hash checks per second/minute. It then uses this metric and other speed tests to estimate the number of cycles needed. The script then cracks a hash with scaling difficulty, based on time needed (estimated). Once the required time delay is met, the payload (from bytes) is saved as tmp and opened.

This codebase is good for devs who can benefit from the benchmarking tests and time estimates, time delay functionality, and general workflow / builder tools for this type of program feature.

IT'S CLEAN

You can see here that ConcreteCracks is 100% whitehat, clean, and using no weird methods. All it does on its own is detect hashing speeds and delay the runtime. This can be helpful for when you need to prevent time attacks / race conditions instead of relying on sys clock which isn't always reliable.

READ THIS:

This is a script & builder codebase. If you aren't a dev and don't know Python, don't buy this. I can

offer support for as-is usage, but this is a dev starter kit for someone to buy & use, not a compiling or coding service. The code is written, provided as-is, and works as described.

Hackers - *November 21, 2025, 9:37 am*

If anyone wants this for \$200 instead of \$250, please PM me and we can set up a new contract. I am closing the sales thread here for now.

I am closing this thread so that it doesn't become an unexpected sale in months from now as I was hoping to support this sale soon after making it. It's a very nifty method

The tool works great by benchmarking a computer's hashing speed, and then using that for an enforced time delay based on the hashing speed initially. This helps with enforced delays so that users cannot skip sleep() or similar logic with time manipulation.
