Thread: [RAT coming soon - Fully modular, Native, Customizable RAT](#)

auxiliary - October 26, 2025, 7:50 pm

Coming Soon: A New Standard in Remote Administration – Powerful, Flexible, & Truly Groundbreaking!

Get ready for a next-generation Remote Administration Tool (RAT) built on a foundation designed for unparalleled flexibility, rock-solid performance, and deep customization. We're excited to reveal a platform engineered to overcome the limitations of traditional RATs. Forget rigid tools – embrace a solution that adapts to you.

Beyond Features: A Truly Modular Core

What makes this different? At its heart lies a sophisticated, fully modular core. Instead of just adding features, we've built an extensible platform. Our unique plugin system isn't an afterthought – it's the foundation, allowing deep integration of custom functionality like never before:

- Transform Your Control Panel: Go beyond simple scripts. Developers can build rich, integrated UI experiences directly into the main dashboard using our dedicated SDK. Imagine custom dashboards visualizing specific logs, interactive system management tools, or unique data reporting interfaces – all running natively.

- Deploy Powerful, Lightweight Agents: Create highly optimized, pure C++ agent modules for the client-side. Our architecture enables complex tasks like real-time keylogging, efficient remote desktop streaming, advanced file system operations, or even custom network proxies (like reverse SOCKS), all communicating seamlessly without interfering with each other.

This isn't just about adding buttons; it's about enabling the creation of entirely new capabilities, ensuring the tool evolves with your needs.

Engineered for Real-World Performance & Reliability

Managing multiple systems efficiently requires more than just features – it demands smart engineering. We've focused on stability and performance under pressure:

- Efficient Multi-Tasking Over Single Connections: Our unique virtual channel system allows numerous independent plugin tasks to run concurrently over a single, secure connection to each client. This drastically reduces overhead and resource consumption compared to tools that require separate connections for different functions. Monitor systems, transfer files, run diagnostics – all simultaneously and efficiently.

- Resilient Communication: Built on a robust, structured communication protocol designed to handle real-world network conditions, ensuring reliable data transfer and preventing common desynchronization issues that plague simpler protocols. Your commands get through, and data comes back reliably.

Stable & Decoupled: The strict separation between the core application, loaded plugins, and communication channels significantly enhances stability. Issues within one plugin are far less likely to impact the core application or other running tasks.

A Platform Designed for Growth

Our initial release targets Windows agents with a feature-rich control panel. However, the core design principles – particularly the pure C++ client-side SDK – deliberately pave the way for future

expansion to other platforms, offering long-term value and adaptability.

Experience the Difference Soon!

We're putting the final polish on this powerful new platform. Stay tuned for more detailed feature spotlights, developer resources, and the upcoming official release. Prepare for a remote administration experience that offers unprecedented power, customization, and reliability.

DramaKing - October 26, 2025, 7:57 pm

This is pretty vague. I'll believe that this is truly groundbreaking and original when there's some evidence.

I have updated OP to provide details, TLDR: Plugin system with cloud repository, scalable server/client, plugin system c++/LUA fully customizable with the UI

MadScientist - October 27, 2025, 8:22 am

Ahh reminds me of Poison Ivy in how you can build your own modules/plugins to integrate from like 20 years ago. I miss some of the old RATs would love to go down memory lane and recollect them but likely not a single uninfected link for most.

Curious to see actual demos of this if it actually comes to fruition.

auxiliary - October 27, 2025, 8:51 am

Yeah, I'm occupied with my career and working on this while I have free time.

Currently in the design phase of the entire architecture, which includes

Server, Client, Backend (Plugin repository, OAuth, API, etc.)

Well if you ever need some testers shoot me a DM, I'll test it out on a VM.

Sounds good.

theRaw - October 27, 2025, 2:13 pm

Do you have an expected release date or month? Looks like it's going to be a nice one!

auxiliary - October 27, 2025, 4:29 pm

MeW11 - October 27, 2025, 5:07 pm

would be great to see more and more open source projects.

DeathPenalty666 - October 27, 2025, 5:13 pm

the post missing lot of detail. It should have some specific details and more info about it because axctually it look like a ai generated short from a free ai and you only has 5 token left on your free plan... One or tho photos, i mean at least the LOGO or anything is welcomem because i feel like you try to sell a bmw on marketplace at 80K\$ perfect condition only one owner but provide a picture of a car form the bmw website... Marketing is the FIRST aspect to ocnsider in a sale thread, And there is so many scam and fake post these day..... Good luck with your sale, No offense buddy :)

I used AI to help with grammar correction and post formatting, but I can assure you that this project is in its design phase.

A logo or image wouldn't change the underlying facts, and once we reach the marketing stage, we'll be offering trial licenses so people can see for themselves. No scams here :)

Glad to hear this!!! I appreciate the reply, this is a step in the right direction!!! Usually when a comment like i did isnt answered or ignored, or try to add way too much detail to answer the comment but not add it in the post and thosek ind of things is a huge first warning of scam alert. It was not to diss your tools or to be an a** i assure you, But providing a little more detail, without saying IT WONT NEVER BE DETECTED, WORK WITHOUT PORT FOWARDING EVEN BEHIND NAT blahblah with a superl ong description but MEPTY OF DETAIL at the end isnt a good introduction. Today there is one who made like 4 post about his rat and even had the nutz to name the thread FREE SOURCEL CODE and asking 50\$ a week and 200 a week so.... Well i hope to read and see more abou your project in the nexts days, week man and i wish you the best luck with your sale!! Welcome on HF :D

I just tested something... GPT adds [] for bullet points when you ask for bbcode and copy to HF if you don't give it the formats of HF.

OP - safe to assume that your team will be selling this soon? Will we get any previews or vouch copies? JC.

Scroll a few posts up.

Nothing wrong with using AI.

You're right, but when you don't provide any screenshots or concept demos or scan results, all we have is a GPT plan for something that could be cool.

I don't use AI for my threads or releases personally. I use AI all the time, but not for posts.
