SMRS-Handler

Simple Multi Reverse Shell Handler

Features Listen for multiple reverse shell connections (TCP).

Auto-assign incremental client IDs.

Interactive console with:

list — view connected clients

use <id> — switch to a client to send commands

helpsh — prints a list of commonly used reverse-shell one-liners (displayed with syntax highlighting)

help — command list

clear / cls — clear screen + reprint banner

exit / quit — close connections and shut down

Per-client output handling: only output from the selected client is printed to your interactive shell.

Non-blocking handling of multiple clients via threads and queues.

Shell one-liners (Bash, Python, PowerShell, PHP, Perl, Ruby, Java, Netcat) included in code (printed by helpsh).

Multiple platforms and formats supported by one handler? I like.

which rat you crypted in the runtime scan you did.

No RAT and no crypting involved it is just a reverse shell handler meant for testing shell connections and managing multiple clients.

I am currently not selling anything.

Hey, Thanks for sharing. I checked out the GitHub and downloaded/tried it. It was pretty intuitive and easy to use. I only had the chance to test with Powershell, Python and Bash one-liner reverse shells that are pretty basic. I will play with it more and augment the code.

Please do test it more because I have not had the time. And thank you for your feedback it means a lot to me!

I have just improved the interface and the whole code with a hint of vibe coding :D. Remember I am still learning, so there may or may not be bugs in the code.

Mind giving the repo a star?

Very nice work! I will conduct a more detailed review of it when I return from being out of town. It definitely has the potential to be really useful. I do think you deserve some rep + !!

Nice, simple, but nice!

I like that you kept it all in 1 file without that 1 file being a bajillion lines of code long

Just goes to show how bloated some tools are

Again, very nice work. I was able to put it through some more paces. It seems to work flawlessly with all of rev shells I have thrown at it. It is a really nice feature, allowing multiple shells to be run simultaneously. I have a couple of ideas if you would be open to hearing them.
