Aembit Introduces Identity And Access Management For Agentic AI

Aembit launches Aembit Identity and Access Management (IAM) for Agentic AI. Aims to provide and enforce access policies for AI agents as they move into production. Nearly half of technology executives say they are already adopting or fully deploying agentic AI, and expect most of their AI deployments to be autonomous within two years.

This seems very secure being able to revoke permissions when needed and confirm every AI action is attributable and auditable.

Vectura - November 2, 2025, 9:25 am

About time someone tackled IAM for AI agents. Once they start acting autonomously, identity control becomes just as critical as for humans or services. Curious to see how Aembit handles policy enforcement at scale.
