Thread: [The "21 Million" Myth vs. Inflation](#)

falkengra - November 15, 2025, 7:13 am

We constantly talk about the 21 million BTC cap. But while we focus on the fixed supply, fiat currencies (USD, EUR, IDR) continue to be printed, making BTC's value relative to a constantly devaluing unit.

If the world moves to a truly deflationary digital asset, which altcoin (not BTC) is better positioned to become the global reserve asset?

Drop your hottest ALTCOIN pick (and why!) below. ?

Axelyn - November 15, 2025, 7:30 am

Honestly, if we're talking about an altcoin that could act like a global reserve asset (without touching BTC), my pick is Litecoin (LTC).

Not trying to shill it, but it checks more boxes than most:

Fixed supply (84M) and no weird burn mechanics

It's been running forever with zero drama

Super reliable, super simple, super predictable

No foundation that can wake up one day and change the rules

Most newer "deflationary" coins rely on hype or centralized teams. LTC is basically the closest thing to Bitcoin in terms of monetary policy, just lighter and cheaper to move around.

Not saying it's destined to be the reserve asset of the world, but out of all the alts, it's one of the few with an actual track record instead of promises.
