Thread: [Bypass \("Windows Defender, MediaFire, Mega..."\)](#)

**Reaper DEEB** - November 22, 2025, 6:13 pm

How does this Bypass work, and all the information about it?

Today I created my application that bypasses (Windows Defender, Windows Defender Scan, MediaFire, Mega...) any Python virus. It took me a long time, and I wanted to share it with you, showing you how I did it and everything about it. This project isn't free; it's simply meant to provide moral support for you in finding vulnerabilities and developing applications. So, stay tuned for a video about the application, how it works, and everything else about it.

## Features

- ? Bypass Windows Defender ()
- ? Bypass All Upload Websites (gofile, mediafire, mega....)
- ? Currently, it only supports viruses made with Python.
- ? An undetectable application that can be downloaded and run whenever the victim wants, never detecting it, just like a normal application.
- ? A virus that has been given bypass can do whatever it wants to an infected device. [warn]

"Bypass Upload Websites?" What is that even supposed to mean? What do you mean by bypass a Python virus?

**Reaper DEEB** - November 23, 2025, 10:39 pm

I meant that Bypass only supported Python viruses, but that has now been fixed and it supports everything. I meant file-sharing sites like MediaFire.
