AutoDox v3.1.0 - An automated doxxing tool

Ever wanted to "dox" someone but found it to have been too tricky and convoluted? This tool aims not only to help you preform OSINT (Opensource Intelligence) but also to learn how to master it. It's a performance enhancing drug for OSINT fanatics or even just beginners starting out in need of a dox tool which can guide them every step of the way.

images:

`https[:]//i.ibb.co/bj9jyK7z/Image2.png`

Do forgive me for the lack of an embed, however this is my first post and this site has strict permissions as it seems.

v3.1.0 Multiplatform

`https[:]//mega.nz/file/XtBhzKZa#W52NtlYiTc39lynx7lxwl413mwVquDI1\_uFXLBeEyKk`

To access, remove the [] brackets and paste inside of your browser's URL bar.

This tool is packed with features that were gate-kept by niche OSINT communities for a while. It includes features that will speed up your hunt for information on a desired individual all while compiling it for you into whatever format you could dream of.

AutoDox is a cross platform tool which includes:

Public Profile Enumerator

Aggregates public profile elements from services where the subject has intentionally shared information, such as:

- Google Maps review metadata
- Public Google profile pictures
- Public Google User ID references
- Username-based social profile discovery (public pages only)

Reddit Public Activity Analyzer

Extremely useful for doxxing a target with an extensive Reddit account history which may have juicy information in it.

- Public posts & comments timeline
 - Activity clustering
 - Topic & keyword breakdown
 - The ability to estimate their timezone and possibly their country of residence though I am sure the posts will reveal a lot more to you
- (Only analyzes data Reddit makes public.)

Data Breach Exposure Checker

You will get a full lookup on emails added to dox search list and any possible database breaches (you may have to cross reference with leak engines in the Manual OSINT part of the program in order to get the full use out of this. When used right you may break into any accounts you desire.

Gaming Platform Metadata

- Roblox profile lookup (public info only)
- Avatar, friends list, public badges, etc.

(Used to have access to username history before that API was deprecated by Roblox)

Phone Number OSINT

- Carrier lookup
- Region & line-type classification

Interactive guide built directly into the tool:

- Fundamentals of OSINT
- How to perform recon on anyone with limited information
- Search engine dorks
- Useful gate-kept guides for information gathering
- Doxxing in gaming communities
- Doxxing based on American databases
- Database leak providers
- Search engines to find data

Should be noted that OSINT is legal so long as the way you find the information is "public knowledge", any features which may run contrary (pretty much none, only discussions of such) are to test on authorised parties (i.e yourself, for fun!) so do keep that in mind. [warn] [warn]

Hackers - November 26, 2025, 2:51 pm

make sure to send my data to 2>/dev/null for best results

Sounds cool though, nice project. Did you make this?

I'm going to research your DL in a readonly system and make sure there are no shenanigans.

Your BAT file:

Code @echo on

"/zulu17-java-jre17.0.17-win_x64/bin/java.exe" -jar autodox-3.1.0.jar

What's the purpose of your specific Java version here? Just curious

AFAIK, you picked a vulnerable Java version specifically to package into your zip. This is sketchy, and your first post being such a hot release... No thx.

Also... Your screenshots are for 3.2, but you are talking about 3.1

Sloppy slop slop;

s0lo - November 27, 2025, 11:06 am

hmmmm, curious to see what others will say
