Thread: [How to setup a RAT with Pics \[TUTORIAL\]](#)

ViperPrivacy - November 29, 2025, 3:34 pm

1. Download QuasarRAT.

<https://github.com/quasar/QuasarRAT/releases>

2. Order nVPN (Dedicated IP \$8,00/mo) + BP Domain(Backup)

<https://nvpn.net/>

<https://anotld.cc/> (BP Domains at 10\$)

After you order it, you will receive email with details to yours account, follow the guide that you receive on the email to get access to the vpn.

Now you can open your port, after that connect to the VPN.

3. Extract and open QuasarRAT

After that go to settings tab and put the port that you have open before, after that click "Start Listening" and click safe.

4. Builder Settings.

Go to the builder tab, and connection settings put IP of your vpn in IP/Hostname section and port that you have open it before on nvpn website.

5. Installation Settings:

First what you have to do is select "Install Client" after that change subdirectory and install name and change it to hidded if you want, and the last thing that you can do is change the startup name for something like "svchost" etc.

6. Surveillance Settings:

The last thing before building the file is "Enable Keyboard Logging" and set the attributes to hidden and now finally click "Build" button, set the name on your file and save it on your desktop.

ServersFcked - November 29, 2025, 5:28 pm

This just looks like a promotion for your VPN/Domain cause its clearly a very basic one i assume with AI

OpalCanidae - November 29, 2025, 5:28 pm

Shock VPN is a cheaper and probably better alternative.

But I mean otherwise it's a solid guide for beginners. 1 thing though I'd like to 'mention' is that if you're at the stage where you're spending money on things like a VPN/Hosting - don't use quasar/pulsar at least get something paid.

I know this also isn't a 'spreading' guide but I still want to mention these things because I feel like they're important either way - youll need a Crypter at well or some kind of obfuscation tool or youll be SoL. The only reason I'm bringing this up at all is because this guide is bringing up paid solutions to VPN and hosting and I want to save someone a little bit of time and energy here.

Funny enough almost as soon as I wrote my comment I thought the same thing. But there are some reviews about it online dating back a few months so.. who knows

DramaKing - November 29, 2025, 7:03 pm

Tutorials belong in Hacking Tutorials, including RAT ones. I am also surprised that anyone still uses Quasar. Why should someone pay attention to a tutorial by someone using outdated tools?

CL1B - November 29, 2025, 7:20 pm

(Nov 29, 2025 08:03 PM)DramaKing Wrote: [\[CITE\]](#) Tutorials belong in Hacking Tutorials, including RAT ones. I am also surprised that anyone still uses Quasar. Why should someone pay attention to a tutorial by someone using outdated tools?

Because almost all common RATs are the same? This process does not differ much from other common RAT and has always been somewhat similar.. didn't you "set up" many yourself? I'm surprised you even asked that question.

Also keep in mind this is the Remote Administration Tools subforum; All thing RATs are welcome here whether that be selling or discussing/informing.

well pulsar with a hostname(that you can get very cheap, i got like 50hostname for 3year at 20\$) s
very good alternative. Also is the rat dont support hostname you must get a vpn with dedicated ip
otherwise its kinda a total waste

Wait. What? nVPN is older then my account here on Hackforums. They were always a very reliable
and reputable service.

Com Puer - November 29, 2025, 9:46 pm

Improved version of QuasarRAT is PulsarRAT.

But I am not getting connection from clients.

check if your port forwarding is fine. usually with port forwarding done, a hostname with client to
match to the ip on a computer it work fine!

i am using it with a computer that dont have static ip using a hostname and with a pc with a vpn
dedicated ip and i dont have any problem with it! So you have something blocking the ocnnection if
you dont get any client

Com Puer - November 29, 2025, 10:16 pm

No Bro,

I can see my port is open.

I tried that client.exe in my main system sandbox it's working fine.

But using another rat execute on client system not working.

Hey, that's just what websites looked like when people actually had to make them themselves, by hand, without AI.

A real craft that I guess will vanish in the next years.

They've just never updated for whatever reason. Must be good enough to pay the bills and then some.

Every piece of information you need is available and the page loads immediately. Likely built on simple, unbloated methodologies. And aesthetically it looks great IMO, maybe I'm a boomer. Also nVPN is OG.

Most VPN websites are slop and take 15 seconds to load.

You're just a child who has grown up on maximal dopamine extraction from every possible dimension every second of your life.

We just boomers now. That's all.

Just the fact that multiple users found the site to be suspicious or a lazy AI gen tells me I'm old as

fuck now. Damn it.

Sometimes RAT payloads don't build properly and won't connect.
Bot accounts aren't allowed on HF, right? Who let [NoodleBot™](#) post?

thanks bro for your statement.

But after reinstalling windows working fine.

anyway thanks a lot for a quick answer.

skozyy - December 8, 2025, 2:01 am

It's no promotion, i have nVPN account since 2012.....

jmethel - December 16, 2025, 6:47 am

Please I need your help on shockvpn, I purchase it but when I open port is not working, and I can
not create my own port apart from the one assign to me
