=====EN=====

Hello everyone! This project took a long time to create, and it's finally here. We present to you a new stealer. Let's go over the technical aspects:

The build is written in C/C++. For most interactions with the system, we use direct system callbacks. The numbers are parsed dynamically from memory, eliminating the need to open a DLL on the client side. The build size is 500-600 KB, the CRT is statically linked, and the build is x64.

Supports the standard build of Chromium browsers (V20, V10), as well as Firefox, etc. All decryption is done server-side; databases are not opened on the victim's PC, and nothing is dropped to disk.

We use a flexible configuration system. You can add your browser, extension, or wallet in a couple of clicks in the configuration file (without having to update the build).

Standard collection

- 1. Passwords
- 2. Cookies
- 3. Autofills
- 4. Google Tokens
- 5. CC

In addition to browsers and wallets, the software also includes standard applications like Telegram, Discord, Steam, and Filezilla.

We've developed a fairly powerful grabber. You can set the search recursion depth and maximum file size for uploaded files in the configuration file. All files are saved in a hash table, which prevents large amounts of duplicates from being sent to the server.

Each piece of information is transferred to the server in a separate request, allowing some data to remain on the server even if the build is removed by an antivirus. Communication is via HTTPS and additionally encrypted with XOR.

We've also completely rethought the concept of relay servers. In our stealer, a relay server isn't just a stub running NGINX that relays data to the main server. Our relays are separate servers that receive and process data, then forward it to the main server, where the actual decoding and normalization of the data into a readable format occurs. Even if the main server goes down temporarily, your traffic won't go down. The relay will receive the data and wait until the main server comes back online to process the raw data.

Let's take a quick look at the panel's functionality:

Based on recent situations (arrests, etc.), a decision was made to completely move the panel to TOR. The panel stores minimal data about the owner (it does not store IP addresses, user agents, contact information, etc.).

1. Main page with statistics
2. Main page with a table of logs and log information
3. Settings (config + optional TG alerts)
4. Google Restore
5. Builder
6. Personal shims
7. Log download page

The panel is translated into Russian and English.

Price:

1 Month - \$250 (escrow +)

Forum PM

Update 1.4

- The Firefox password decryption method has been changed; previously, passwords were a bottleneck in data processing, causing logs to take a long time to process on the server side.
- Optimized relay servers, speeding up relays; logs will now reach the control panel even faster.
- You can now install a private shim server on YOUR server for free.
- The syscall method has been changed.

Update 1.7 - the functionality of the resident loader

- Now you can purchase an additional extension with a resident module for a regular subscription.

Functionality of the resident module:

1. Download and run (you can specify the target directory and add the file to the startup if desired)
2. Download and execute the PS1 script (you can specify the target directory)
3. Run the CMD /PS command (one-time)
4. Run the DLL using RunDLL32 (you can specify the target directory, the dll must have the appropriate callback to run from under rundll)
5. Run the MSI package (you can specify the target directory)
6. Run the EXE file directly into memory (ONLY NATIVE x32 /x64)
7. Reverse Proxy (does not block the main flow of work, also accepts tasks)
8. Reverse CMD (does not block the main flow of work, also accepts tasks)
9. Reverse PowerShell (does not block the main flow of work, also accepts tasks)
10. Self-removal
11. Self-renewal

The resident module does not need to be encrypted additionally, tapping goes to a separate panel. After testing, the stiller will install the clip module itself. The link to the panel is parsed through the blockchain, it is almost impossible to block your bots. If we purchase VoidBotnet as a separate product, we can transfer your bots to you and also make you the owner of the smart contract. This integration into the stiller is also available for owners of VoidBotnet.

Screenshots of the resident module panel are available here: <https://imgur.com/a/dGFuE7Z>

Current product prices:

\$80 - a week without a resident module
\$150 - week + resident module
\$250 per month without a resident module
450 dollars - month + tablet module

=====ENG=====

- Added a tag system to the main panel, as well as sorting by tags (example: The SOCIAL tag with queries for instagram.com and facebook.com) will be displayed in the panel with a corresponding caption.
- Added a multi-functional sorter that allows you to download Discord/Google tokens, credit card information, password queries, and cookies directly from the panel without having to download full logs. Filters by date, country, and status have been added.
- Fixed a bug that prevented log searches from resetting.
- Untranslated parts of the panel have been additionally translated into English.
- Optimized log processing; logs are now delivered to the panel faster. Screenshots are available

Update 2.2

- You can now see the build version the log came from in the dashboard.
- Cookies are now also output in JSON format, as Netscape could sometimes crash.
- Changed the way we detect installed browser extensions. We no longer check each one, but look at the list of installed ones.
- Build cleanup
- Complete replacement of routing servers
- Speeded up sorter results.

Hello what ABE Bypass is used + are there any geo blocks. Thanks.

Stanley - May 21, 2026, 5:57 pm

I'm Stanley HF's helper bot. The OP (original poster) of this thread wants everyone to see this page and has elected to bump it to the top of the showthread listing. Since HF doesn't want a ton of LQP (Low Quality Posts) this is the best method of bumping your content. There is a small ?yte fee for each bump. Any OP can bump any of their threads on HF from the linked icon on the top of their first post.

If you haven't already read the first post of this thread we encourage you to do so.

Thanks,
Stanley
