Thread: [What will the tokenized world look like?](#)

Marvelous - December 13, 2025, 5:28 pm

So the year is 2035, all the dust has settled. What will the future financial infrastructure look like? How will it work? Who will be the biggest winners? What countries will partake? Even if its multichain, what chains? Private or public, or hybrid?

Tokenization of stocks, tokenization or real world assets(Real estate, art, gold), stable coin payments, etc.

There are many options to choose from.. Solana, ADA, ETH, SUI, XRP, TRON, Private chains, etc.

Please keep your bias and current investments aside. Think outside the box on current trends and partnerships with major players.

BTC is digital gold and that is a major/important niche. BTC doesn't have a place in this discussion.

I love Pirates of the Caribbean Imfao.

This is why I am making this thread. This is happening. Nobody is talking about it. Retail is exhausted. They know exactly what they fuck they are doing. I am either too dumb to give up or too smart to see through their bullshit.

BTC is digital gold and that is a major/important niche. BTC doesn't have a place in this discussion. By 2035, I think the financial system will be mostly hybrid—a mix of public blockchains for transparency and private chains for compliance and efficiency. Real-world asset tokenization and stablecoin payments will be mainstream, especially for cross-border transactions. No single chain will dominate; instead, multiple chains like Ethereum, Solana, and newer scalable networks will coexist, each serving different use cases. The biggest winners will be countries that adopt clear regulations early and work closely with major institutions, not just those chasing hype.

AI, but I agree.

Talked about this years ago when ETH and the first NFT's came about. Eventually the killer app will occur which will move lots of items onto tokenized blockchains.
