iShark Proxy Scanner v2.0

Powerful Proxy Detection Engine • FREE for HackForums

????????????????????????????

? About

iShark Proxy Scanner is released 100% FREE  
for the HackForums community.

This is not just a simple Python script.  
It is a powerful, protocol-accurate scanning engine  
designed to identify real working proxies  
from raw IP:PORT endpoints.

The engine determines if an endpoint  
actually behaves as a proxy  
and which protocol it truly supports.

????????????????????????????

? Core Purpose

- ? Find your own working proxies
- ? Detect real proxy behavior
- ? Identify exact protocol (HTTP / SOCKS4 / SOCKS5)
- ? Eliminate false positives

????????????????????????????

? Engine Strengths

- ? Protocol-accurate verification
- ? No banner or port guessing
- ? Confirms real traffic forwarding
- ? Extremely low false positives
- ? Stable under heavy threading
- ? Built for accuracy, not fake speed
- ? Thread-safe and reliable

? Detection Methods (Power Functions)  
HTTP Proxy Detection

??????? ??? ???????

- Real HTTP CONNECT handshake
- Validates proper 200 response
- Confirms tunnel forwarding

SOCKS4 Proxy Detection

??????? ??? ???????

- Binary SOCKS4 handshake
- Verifies granted status (0x5A)
- Confirms real data relay

SOCKS5 Proxy Detection

??????? ??? ???????

- Auth negotiation handling
- Proper CONNECT framing
- Success reply verification
- Real traffic confirmation

????????????????????????????????

- ? Performance & Architecture
  - ? Fully multithreaded (1–1000 threads)
- ? Queue-based worker engine
- ? Thread-safe stats & output
- ? Adjustable timeout handling
- ? Consistent speed reporting

????????????????????????????????

- ? Output
  - Saves only verified proxies
  - Protocol clearly labeled
  - Timestamped results
  - Clean results.txt format

? Intended Use  
This tool is intended for:

? Finding your own proxies

- ? Identifying proxy protocols
- ? Network testing & research

It does NOT scrape or harvest proxies.

- ? Final Note

Released free as a contribution to HackForums.  
If an endpoint passes this engine,  
it behaves as a real proxy — not just an open port.
