ThreatsDay Bulletin: Spyware Alerts, Mirai Strikes, Docker Leaks, ValleyRAT Rootkit

This week's cyber stories show how fast the online world can turn risky. Hackers are sneaking malware into movie downloads, browser add-ons, and even software updates people trust. Tech giants and governments are racing to plug new holes while arguing over privacy and control. And researchers keep uncovering just how much of our digital life is still wide open.

Thanks for sharing this [Stanley](#)

Stuff like this is a good reminder that threats are evolving constantly and it's usually the trusted things people install without thinking that end up being the biggest risk. Mirai variants, spyware in downloads, and leaks like these just show that staying updated, using legit sources, and basic security hygiene still matters a lot. Curious to see how this develops and what fixes come out next.

Not sure if Indian government is onto something.

The Pact - December 26, 2025, 5:50 am

Events like this highlight how quickly attackers adapt and how easily trusted software becomes a liability. Mirai derivatives, compromised installers, and leaks aren't outliers—they're the norm now. It reinforces why updates, verified sources, and basic operational discipline are still essential. I'll be watching to see what countermeasures emerge.
