Thread: [Mass SMTP Finder + Creator Tool 4price shop](#)

User2006 - December 25, 2025, 6:28 am

Mass SMTP Finder + Creator Tool is an advanced dual-purpose email configuration utility designed for bulk processing of cPanel credentials to discover existing SMTP configurations and create new email accounts efficiently.

Core Functionality: The tool operates in three distinct modes: SMTP Finder (discovers existing SMTP configurations from server files), SMTP Creator (generates new SMTP accounts via webmail systems), and Both Operations (combines finder and creator for maximum results). It processes cPanel credentials in the format [https://domain.com:2083](#)|username|password with support for bulk operations.

Advanced Features:

- Concurrent Processing : Configurable threading system (1-20 threads) for optimal performance
- Deep Scan Mode : Aggressive file enumeration and parsing for comprehensive SMTP discovery
- Credit-Based System : Each cPanel operation consumes 1 credit with real-time balance tracking
- Real-Time Monitoring : Live progress tracking with detailed statistics (total, processed, success, failed)
- Smart Categorization : Results are automatically sorted into Found SMTPs, Created SMTPs, and Errors

User Interface: Modern responsive design with gradient backgrounds, tabbed results display, and intuitive controls. Features include progress bars, statistics cards, and export functionality for all result categories.

Output Management: Results are saved in standardized format (host|port|username|password) with separate files for found SMTPs (SMTPs.txt) and created SMTPs (SMTPs_Create.txt). Export options allow downloading individual categories or complete result sets.

Security & Performance: Built with Laravel framework, includes CSRF protection, secure credential handling, and optimized database queries. The tool prevents credential logging and implements rate limiting for server protection.

Use Cases: Ideal for email marketers, system administrators, and digital service providers who need to efficiently manage large volumes of email configurations across multiple cPanel accounts.
