Thread: [From \\$10k to \\$100k Monthly Crypto Scam Methods](#)

bonorzstar - January 3, 2026, 5:49 pm

I put together a guide that's been tested by a lot of people and gave strong results. It covers what drainers are, how they work, and the strategies scammers use to get the most out of them. Yesterday in a Telegram chat, someone even shared a screenshot showing he made 17 Ethereum (\$50353.53) in a single hit.

Hidden Content

[hide]Introduction: What are drainers?

An Ethereum drainer is a type of crypto scam that targets wallets on the Ethereum blockchain. It's essentially a tool designed to steal your cryptocurrency. Here's how it typically works: scammers create a fake website or app. This could be a fake airdrop claiming to give away free tokens, a phishing site mimicking a legitimate crypto project, or something else entirely. They trick you into connecting your wallet. The website will prompt you to connect your Ethereum wallet in order to claim the fake tokens, interact with the app, or perform some other action. The drainer steals your funds. Once your wallet is connected, the malicious code in the website or app requests permission to transfer your assets. If you approve the transaction (often disguised as something harmless), the drainer can siphon off all or some of your crypto holdings. Most often, drainers are services provided by their developers who take a cut of the profits.

Step 1: Obtain a drainer

The first step is to acquire the drainer software. You can just DM or contact someone who does this line of work, or do some research. A popular choice for this is Exo, which you can acquire through its specific channels, typically found on private forums or encrypted messaging apps. Exo also has its own website where you can find more information and contact details for acquiring the service.

Step 2: Pick the Type of Project

To drain, the most important part is to look trustworthy. You have to create a website and somehow make people connect their wallets. The most common ways are airdrop and exchange. You can think of many new ideas. If your idea is unique and even more trustworthy, then you can earn a lot.

Step 3: Purchase a Domain

Buy a domain from Njalla (njal.la); that's what most people in the draining community use, or if you want to risk your domain getting flagged for cheaper options, you can use Namecheap (namecheap.com). I do not recommend using Namecheap; use Njalla if possible. You can buy with crypto on both platforms.

Step 4: Host Your Website

This is pretty straightforward. Sometimes the drainer devs themselves provide a hosting service and you can contact them. This is also true for Exo developers, who often offer hosting solutions to simplify the process.

Tools

To successfully execute this operation, you will need a specific set of tools. The core component is

the drainer script itself, such as Exo, which handles the wallet interaction and asset theft. A key feature of Exo is that all digital transactions between you and the victim are transparent; you see them just as the website does, which increases credibility. For your online presence, you'll need an anonymous domain registrar like Njalla to avoid easy takedowns and protect your identity. Hosting should be set up with a provider that ignores DMCA takedowns, often referred to as "bulletproof hosting," or you can use the hosting service offered by the Exo developers. For traffic generation, you'll need accounts on advertising platforms like Twitter/X and Google Ads, or access to email lists and social media accounts for spam and social engineering campaigns.

Step 5: Spreading

Spreading means the method of getting traffic to your website. It's useless to have a drainer website if you can't get the right traffic to it. Methods of Spreading: The most commonly used spreading methods are Twitter ads, Google ads, email spam, and social engineering. You try to get more help in draining communities. [/hide] [warn]
