Thread: [\[UPDATE\] EREBUS RAT: The Great Migration to Native C++ | iOS Mobile Panel](#)

femida - January 10, 2026, 3:45 pm

EREBUS

EREBUS RAT | Native

The Core Evolution

The project has undergone a complete architectural migration. The client is now written in Native C++.

Zero dependencies (No .NET, No Java).

Minimal binary footprint and optimized memory usage.

Improved performance and native execution.

Advanced low-level capabilities for module development.

Erebus Ecosystem

We are expanding beyond a simple tool into a complete professional environment:

iOS Control Panel: Native mobile application for on-the-go management (95% complete).

ErebusStudio: Dedicated standalone IDE for custom plugin and module creation.

Web Infrastructure: Centralized portal for management and deployment.

Current Status

The project is in active development. Current focus is on finalizing the mobile engine and bug-squashing.

Sorry but only Leet and other upgraded members are allowed to post offsite communication.

This keeps the number of scammers down and is also fair in that people pay for advertising one way or another most of the time. <https://hackforums.net/upgrade.php>

Add good stealer in it with the latest decryption. Auto tasks (like run stealer, defender exclusions and other stuff) are greatly appreciated too. Would be nice if you could provide some TG where I could get in contact with you

Is project out?

Some very useful features that you may consider adding:

Web Panels for admin and team

Process Injection

HVNC for browsers

Anti WinRes

Process killer for AV installers and windows creation media

Auto remove for .iso files(makes reinstalling OS harder)

Customizable tg notifications (each team member should set notifications for himself)

Auto tasks (And also auto execute script when pc becomes online, in case script has to be executed but pc is offline)

DNS poisoning

ARP Spoofing

Hosts hijack

Defender killer

Elevate as System
