How Roblox Turns Play Into Learning

Roblox is redefining how young people learn by turning play into participation. Through its Learning Hub and creator-built worlds, students learn coding, systems thinking, and collaboration by building and experimenting in real time. Rather than digitizing lessons, Roblox enables experiential learning—where kids co-create knowledge, practice skills, and learn by doing in immersive environments.

I think only those kids who are making games within roblox and innovating within it with their tools are actually learning. They learn to code, work together as a team, adopt a solution oriented mindset and potentially make money too.

Rest of the kids are just consuming and playing games.

Right? Just playing... might be learning a miniscule amount.

I mean. Every kid plays video games. In fact many adults grew up playing and still do. Video games aren't really a domain for learning. It's like saying I'm learning after binge watching any random TV Show. Like no. You don't learn by jist playing any game.

I agree with this statement

The games I have learned from... are geography, history, cultures, etc, from grand strategy games like Crusader Kings, Europa Universalis, and Hearts of Iron. That's it. ?
