Thread: [Bitcoin Vanity Suffix Generator - BtcStringAddyForce by nodes](#)

Hackers - February 18, 2026, 5:56 am

BTC STRING ADDY FORCE

Here is something I made the other day with GPT Codex for Mac. It took less than 10 minutes and then I played around with converting to Go, but ended up keeping it as Nodejs.

SOURCE CODE

Quote:github: LNodesL/BtcStringAddyForce

safe commit hash / last commit as of today:

BtcStringAddyForce

The software easily allows you to find Bitcoin addresses with a suffix ending. It's nice to see what you want to see in the address transaction lists! Why be a loser with a random address when you can have your brand or name at the end of every TX row for all your sends & receives?? Digital wallets are the norm for most customers, so you might as well optimize your marketing for it.

Easily swap address types for suffix requirements:

I ran through just under 2.2M address checks to find an address ending with "hack". It's much faster to find 3char endings, as I'll show below. But very easy to find 4-5 chars too if you let it run for 5-20 minutes depending on luck.

Numerical Ordering for indexing & logic is another great use case for this software. You can have a set of addresses with clear numbering to make your life easier. You can also think about addresses in a totally different way, such as using suffix endings to trigger logic in contracts or off-chain servers for even more anonymity or plausible deniability, without ever storing a full address string to do it.

(Feb 18, 2026 04:41 PM)Lefty Wrote: [\[CITE\]](#) Hmm interesting. Not sure when I would use it but appreciate it though

Fair enough, it can be useful if you do want some addresses that show up with your desired ending. I'll run a test on 'lefty' to see how long it takes.

adding the repo to the thread if anyone wants to clone & run (npm install && npm run start)
