Thread: [Gaming, crypto, healthcare, adult product ads approved : Trafficguardian cloaking s](#)

gillay - February 19, 2026, 11:41 pm

In today's time, running ads in niches like gaming, crypto, healthcare, and adult products is not easy. Platforms like Meta, Google, and other ad networks have become very strict with their policies. Automated bots, crawlers, and manual reviewers frequently scan landing pages. Because of this, ads often fail to get approved or get disapproved after running for some time.

TrafficGuardian is designed to solve this exact problem. It is not just a basic cloaking tool it focuses on advanced traffic filtering and visitor verification.

How TrafficGuardian Cloaking Works

TrafficGuardian checks every visitor before allowing access to the landing page. It identifies whether the visitor is a real user or a bot, reviewer, or scanning tool.

Ad platform bots and reviewers are shown a policy-safe decoy page

Real users are redirected to the actual landing page

This process is fully automated and does not affect the real user experience

Because of this, ads stay safer during the review phase, and the risk of unnecessary disapproval is reduced.

Key Features of TrafficGuardian

Advanced bot and crawler detection

IP, network, and ASN-level filtering

Device-level filtering (Android, iOS, Desktop)

Location and country-based access control

Option to manage multiple landing pages

Protection from fake clicks and competitor scans

All these features work together to make ad accounts more stable and reduce sudden policy issues.

Google, Meta, and other major ad networks treat cloaking as a violation of their policies, and accounts using these methods often end up getting suspended once detected—sometimes even after initial approval.

saju - *April 23, 2026, 11:39 pm*

Even today, many advertisers still use cloaking, especially those who know how it works. They understand the risks—accounts can get suspended and cloaking can be detected but they still try it to run certain types of ads.
