Thread: [\[RELEASE\] OBLIVION Panel for Android HVNC, VNC, Keylogger. Google Play Protect bypa](#)

oblivionDEV - February 22, 2026, 9:27 am

Hey guys,

We've been quiet for a while, but trust me — it was worth the wait.

Today we're officially dropping Oblivion — a fresh, hardcore Android RAT that straight-up shatters expectations in 2026.

This isn't some recycled Chinese clone full of bugs and fake "lifetime" promises. This is our from-scratch project, built from the ground up with a laser focus on rock-solid stability, stealth, and actual usability.

Builds have been running in the wild with testers and real users for over 4 months now — zero crashes, zero behavioral detections. It just sits there perfectly, like it belongs.

Key features (fully working on Android 8 through 16):

- Full VNC + HVNC (hidden mode)

HVNC disguises itself as a system update — the victim sees the classic "System updating..." animation, their screen is locked, and you're controlling everything like it's your own device.

Now you can fully customize the overlay with your own HTML — fake HyperOS update, antivirus scanner, whatever you want. In our tests, this is the fastest VNC out there right now.

- Auto-permissions via custom smart algorithm

Bypasses literally everything: MIUI/HyperOS, One UI, ColorOS, MagicOS, OxygenOS, stock Android — Accessibility + all critical perms granted automatically, no annoying pop-ups, no victim taps needed.

- Full SMS control (read, send, intercept 2FA codes, block incoming messages)

- Keylogger — catches everything: PINs, passwords, every keyboard press, every tap on any button or UI element. Real-time logs, zero lag.

- Auto Unlock — automatically unlocks via PIN, password or pattern. Works even after reboot (unless the user manually changes the lock method).

- Full list of installed apps + launch / uninstall any app

Total control: open whatever, delete whatever — no traces left in the victim's logs.

- Screen Reader mode with beautiful element rendering

Lets you bypass black screens on locked VNC sessions (the trick banks & crypto wallets use) — control stays smooth and completely invisible.

- Notification control (read, hide, snatch codes from bank pushes, etc.)

- Anti-removal is insane — blocks every attempt to revoke permissions, uninstall the app, or disable Accessibility. Especially brutal on MIUI/HyperOS, MagicOS, ColorOS, One UI — where most RATs die in 2–3 days, Oblivion lives for months. Multi-channel self-recovery + complete icon/process hiding.

- Stability is next level — builds stay alive for months without needing reboots. Server handles 1000+ sessions with no sweat, super low ping even over Tor/I2P.

Month - \$300

3 months - \$700

6 months - \$1300

Year - \$1900

Forever - \$2200

Oh sorry , Looks nice good luck in sales .

nethoodus - February 23, 2026, 2:43 am

Looks interesting. Tell me, is the server panel located on your server? Can I run it separately?

oblivionDEV - February 23, 2026, 3:06 am

(Feb 23, 2026 03:43 AM)nethoodus Wrote: [\[CITE\]](#) Looks interesting. Tell me, is the server panel located on your server? Can I run it separately?

Yes, the panel is currently hosted on my server, but only temporarily - I launched it for testing purposes.

After purchase, you will receive the fully working source code for both the server and the client with the loader, so yes - the panel is ready to run.

nethoodus - February 23, 2026, 3:20 am

Unfortunately, I can't send private messages yet. Perhaps you have a Discord or Telegram contact? I wanted to clarify a few things: will you be renting or permanent, etc.? If possible, please provide your contact information either here or on your website.

Awesome, please someone who's been around the forum for a while and has been very active, not random upgraded ones

Thank you! very excited to see such a project rise

oblivionDEV - February 27, 2026, 11:47 am

By the way, we will soon be releasing a major update

ugreen - February 27, 2026, 10:34 pm

bro add in discord or send tox xmpp tg something plz cant send u pm.

moshearmro - February 28, 2026, 6:51 am

hopefully in the next update, the author will add a video to the login screen where I fuck his mother. using gpt, of course.

oblivionDEV - February 28, 2026, 2:30 pm

(Feb 28, 2026 07:51 AM)moshearmro Wrote: [\[CITE\]](#) hopefully in the next update, the author will add a video to the login screen where I fuck his mother.

using gpt, of course.

Don't fucking embarrass yourself, delete this shit.

MAJOR UPDATE

We're taking control, evasion, and flexibility to the next level. This is the strongest drop yet.
Latest Power Additions & Upgrades:

Obfuscator massively upgraded

-> Maximum antivirus bypass achieved

New Builder toggle:

Enable / Disable anti-removal / self-protection with one click

New stealth feature: Completely hide application icon

-> Dramatically improves AV evasion

-> Proven to bypass Kaspersky and AhnLab V3

-> Stability fully tested - clean and reliable in live environments

Full panel redesign

-> Cleaner UI, significantly better stability & performance

VNC / HVNC module heavily optimized -> Smoother, more stable remote sessions

Client connections stabilized -> Fewer drops, faster & more reliable reconnections

New social engineering powerhouse: Fake bank & crypto wallet push notifications

-> Tricks victims into entering PINs/codes instantly

-> Keylogger captures everything in seconds

Keylogger completely rebuilt

-> Now defeats additional protections in hard-to-crack apps

-> Works flawlessly across 100% of targeted software

Anti-removal hardened to the absolute max

-> Once installed, most AVs can't touch it anymore

Brand new customization feature: Edit on-screen text for HVNC

-> Customize labels and messages directly on the HVNC screen

Multi-language support expanded:

-> 14 languages instantly available for editing:

Accessibility page

Loading page

HVNC page

-> Quick, one-click language switching & text customization for better social engineering and localization

Current max FUD combo:

Hidden icon + upgraded obfuscator -> shredding detections on Kaspersky, AhnLab V3, and other tough AVs.

Does it trigger Google Play Protect when the payload is opened "Send app for security check", "This app is unknown to play protect", my friend tested it and it prompted that few days ago?

oblivionDEV - February 28, 2026, 8:14 pm

For FUD you need to rebuild the client every couple of days.

Right now the obfuscator strength has been increased, I don't know exactly how often you need to rebuild now, but it's clear that you still have to do it

(Feb 28, 2026 09:14 PM)oblivionDEV Wrote: [\[CITE\]](#) For FUD you need to rebuild the client every couple of days.

However, this doesn't mean that older builds suddenly become detectable (or removable) on the infected device.

Once installed, deleting it through regular means or even using antivirus software is practically impossible / not feasible.

yaoyangnime - March 2, 2026, 5:02 am

From the video, it looks like you gotta switch on Accessibility Service yourself; it doesn't just happen automatically.

d3athgiver - March 2, 2026, 7:13 am

Right once it's installed you should be good to go. There is a tool in market where you select your apk, give it a service name and build a exe file with the apk. Then you enable usb debug and plug your android to the pc and the apk should auto install on the phone at root level and bypass playprotect from there!!! You can now use the phone to spread to other device with USB cable and via charging station to other device dlcennected (USB debug must ne on for all the step) it also auto infect android emulator on computer automatically.

I used this tool to bypass a box restriction!!! Can't install apk from external device and apk not from their store. So I binnded my apk with aptoid amd the real play store. No more restriction haha.

When it's on the device it don't trigger anything! No play protect or anything even if you scan it.

oblivionDEV - March 2, 2026, 7:46 am

the apk. Then you enable usb debug and plug your android to the pc and the apk should auto install on the phone at root level and bypass playprotect from there!!! You can now use the phone to spread to other device with USB cable and via charging station to other device disconnected (USB debug must be on for all the steps) it also auto infect android emulator on computer automatically.

I used this tool to bypass a box restriction!!! Can't install apk from external device and apk not from their store. So I binnded my apk with aptoid and the real play store. No more restriction haha.

When it's on the device it don't trigger anything! No play protect or anything even if you scan it. That's what a dropper is for

(Mar 2, 2026 06:02 AM)yaoyangnime Wrote: [\[CITE\]](#) From the video, it looks like you gotta switch on Accessibility Service yourself; it doesn't just happen automatically.
Accessibility Service is needed to automatically obtain all permissions
Where did I say that Accessibility Service is obtained automatically?

(Mar 2, 2026 08:13 AM)d3athgiver Wrote: [\[CITE\]](#) Right once it's installed you should be good to go.
