Thread: [AI vs HUMANS](#)

Mr. Undefined - February 23, 2026, 11:41 pm

Hello everyone,

Yesterday, my friends and I were talking about Artificial Intelligence and how it's getting into our daily use.

i want to ask you people, if AI becomes smarter than humans in every way, how can we make sure it acts in ways that match human values, especially when people don't always agree on what's right or wrong?

Leave your comments and your reviews on the same

In my opinion, AI really depends on the humans who guide it. If it is used with good intentions, it can bring many benefits and help in various aspects of life. On the other hand, if it is used with bad intentions, AI can be misused and cause negative impacts. So, it's not only the sophistication of the technology that matters, but also the responsibility and ethics of the people who use it.

Thanks for your opinion , and I totally agree that AI itself is neutral and acts as a tool; its impact depends on the intentions and responsibility of the people who create and use it. When guided by strong ethics and proper oversight, AI can bring great benefits and solve complex problems. However, without accountability, it can be misused and cause harm. Therefore, the key issue is not just how advanced AI becomes, but how responsibly humans manage and regulate it.

In fact, artificial intelligence is very useful and I rely on it a lot... but it won't take over the world—or at least, that's what I hope.
