When AI DDoS'd the Real World: The Bubble Tea Incident That Exposed the Agentic Ec

An AI chatbot generated 10 million orders in 9 hours, triggering a real-world logistics breakdown.

Even a 1% failure rate at AI scale equals millions of errors.

This exposed the Digital-Physical Throughput Gap, where AI demand outpaces human infrastructure.

Agentic AI is not just automation, it is machine-speed economic execution.

Without stress testing and constraint-aware architecture, AI-driven systems will create systemic volatility.

AI doesn't need to be malicious to break systems.

It only needs to be faster than the infrastructure it connects to.
