ThreatsDay Bulletin: Kali Linux + Claude, Chrome Crash Traps, WinRAR Flaws, LockBit

Nothing here looks dramatic at first glance. That's the point. Many of this week's threats begin with something ordinary, like an ad, a meeting invite, or a software update.

Behind the scenes, the tactics are sharper. Access happens faster. Control is established sooner. Cleanup becomes harder.

Here is a quick look at the signals worth paying attention to.

AI-powered command

A lot of threats now look normal at first.

They can start from something simple like an ad, invite, or update. That's what makes them dangerous, because people trust them too fast.

By the time you notice, the damage may already be done.

DramaKing - March 7, 2026, 5:03 am

I don't think that I knew about this WinRAR vulnerability.

shakur123 - March 10, 2026, 9:49 pm

The pattern is familiar: boring entry points, serious consequences.

Most breaches still start with something simple—ads, phishing, updates—while the real sophistication shows up after the initial access, when attackers move fast to gain control.
