Thread: [What should I look for when hiring an Ethereum token development company](#)

anvi7470 - March 16, 2026, 10:23 pm

Great question, and honestly, something more people should research before jumping in.

When hiring an Ethereum token development company for the first time, start by checking their smart contract audit history. A reliable team will always recommend third-party audits before deployment, where actually a green flag. Also, look at their GitHub activity or past token projects they've shipped publicly.

Communication matters more than most people expect. You want a team that explains technical decisions clearly, not just delivers code.

Token standard selection, such as ERC-20, ERC-721, or ERC-1155, should be a conversation, not a decision they make alone.

I found this resource helpful when I was researching the process gives a solid breakdown of what the development lifecycle looks like.

Most tokens don't even get to the market before the owners cashout the profit and run away, have seen over 5-6 startups doing this scheme. Pump.fun is full of these telegram token startups.
