ChangeNOW Launches Private Send to Break Blockchain Address Tracking

Private Send is a feature designed to prevent direct links between sender and recipient addresses on public blockchains. Instead of a direct wallet-to-wallet transfer, funds are routed through ChangeNOW infrastructure before reaching the final address. To the recipient, the transaction appears standard, while the sender's address does not appear in the recipient's transaction history.

This isn't "privacy," it's obfuscation-as-a-service.

ChangeNOW inserting itself between sender and receiver breaks on-chain traceability, but replaces it with trust in a centralized intermediary.

Net: harder for casual tracking, not invisible—just shifting where the risk and visibility live.

The worst system known online for exchanging currencies at usurious rates, truly poor those who fall for that service
