Thread: [What Are the Must-Have Features to Include During BEP20 Token Development?](#)

anvi7470 - March 19, 2026, 5:51 am

The blockchain space is evolving globally with new possibilities. Entrepreneurs are moving towards BEP20 token development because of its low transaction fees and high-speed performance of BSC compared to other networks.

But did you know what truly makes a BEP20 token successful? It all comes down to the features built directly into its smart contract.

That's exactly why businesses need to get the right functionalities in place from the ground up to ensure security, utility, and long-term value. Some of the key features that make a BEP20 token truly stand out are mint and burn functions, ownership transfer controls, anti-whale mechanisms, tax or reflection logic, staking compatibility, blacklist/whitelist functionality, and so on.

These features basically serve as a backbone for every BEP20 token to sustain in the blockchain market.

If you're looking to build one, Maticz is a well-known BEP20 token development company that can help you get it done right.
