How to bypass encryption and client isolation on Wi-Fi networks using AirSnitch

I found out about AirSnitch a few weeks ago, but I was waiting for the motivation to do a full writeup. I eventually decided that instead of researching and summarizing the articles that have been posted on the new exploit, I would create a new notebook in NotebookLM. If you live in one of the allowed regions or have a proxy/VPN, go to the link below and find out all you want to know.

<https://notebooklm.google.com/notebook/243185bd-96a0-46f3-a61b-b8ff5431170b>

But to be brief, AirSnitch is a MitM technique that allows an authenticated attacker to intercept Wi-Fi connections. It works by spoofing the victim's MAC address with an ICMP ping and then restoring the mapping with another ping to intercept the bidirectional traffic. Or something like that. Gemini could probably explain it clearer.
