Thread: [Here Are 5 Of The Best Ways To Hack An Instagram Accounts](#)

moonsh1n3 - March 25, 2026, 12:46 am

1- keylogger

~

You can use keyloggers to hack an Instagram account fast and easy. A keylogger is basically a special software program that can record your victim's keyboard activity to the alphabet level and save the information in a file. This means that when your victim logs into Instagram with their username and password, the keylogger will save the details just for you. If you want to hack an account from a computer you can use Keylogger but since 95% of users access Instagram via mobile devices, we recommend using mobile keylogger apps such as mSpy, iKeyMonitor etc.

mSpy has been around for quite some time and keeps on adding new features every so often. The spy app gives you access to everything happening on Instagram including photos, messages, contact lists, videos and much more. The app has a keylogger feature that will allow you to easily hack your targeted victim's Instagram password.

mSpy basically sends you all the media stored on the victim's mobile phone. The application can even monitor and hack other platforms such as Snapchat, WhatsApp, Viber, and many more. Hacking Instagram via mSpy is currently available for both Android and iPhone devices.

~

2- iKeyMonitor

~

If you are on Android or iPhone, you can use iKeyMonitor which can record everything typed on the victim's mobile device. It will even send the results to you online which means you won't have to physically access the victim's mobile device. To start using iKeyMonitor, simply head to their official website and create a new account. It's actually a paid keylogger service but you get a 3-day free trial which is enough to get the data that you need.

FlexiSpy is another high-quality spy program that can spy on Instagram and show you most of the activities taking place on the social media platform. It has the latest spying features for other popular social media platforms including Skype, Facebook, and Instagram. Another great thing about FlexiSpy is its call recording feature. It works in the same way as mSpy in hacking Instagram passwords.

Other popular spying apps include XNSPY and Mobistealth. Both cover Instagram in their spying capabilities and can be used on iPhones and Android devices. Hacking Instagram using any of the above mentioned apps is quite easy.

All you need to do is buy the software license online, download the app and install it on the phone or device that you plan to hack, and then watch all the reports including logging details being relayed on your online dashboard. You don't have to be near the hacked person. You can access the data from anywhere in the world as long as you have an Internet connection.

Brute force basically refers to a hacking technique that tries to crack a password using every possible combination of phrases or words. The method usually uses a list based on a given input to crack the password.

The brute-force method requires special cracking software made specifically for password cracking purposes. One of the most popular password cracking software is InstaRipper.

InstaRipper, available at [InstaRipper.com](#), is an app that every Instagram user deserves to have, or

at least know about. It has a powerful password cracking feature that can allow you to recover your lost password within a few minutes. However, the authors of the program clearly state that they will not be held responsible for any illegal activity that users may perform using the tool, such as hacking other people's accounts without the account owners' consent.

To avoid Instagram from blocking your IP, the tool comes with a mask feature that allows it to change to new fresh IPs after a few failed login attempts. It does this automatically without arousing Instagram's attention. InstaRipper has its own VPN server that provides it with virtual IP addresses to allow you unlimited cracking attempts. It's a user-friendly and easy-to-use software program that works on all modern devices including mobile and desktop devices. It supports Windows, Mac, Android, and iOS platforms.

~

3- Phishing

~

There are many ways of creating a fake Instagram login page but the easiest one we know so far is via Z-Shadow. Simply go to Z-Shadow, open a new account and then log in to your account. Scroll down and click to get to page three which shows a wide range of pages you can clone. Instagram is number 35 on the list. Simply copy the link and paste it on a new tab then press enter to see the Instagram clone page you've created. If anyone logs in via this page, you'll capture their login details including passwords. You'll find the passwords in your Z-Shadow account when you click on My Victim. It's an easy and effective way of hacking Instagram passwords. All you need to do is to send the unsuspecting victim to your fake login page.

~

4- Password Reset

~

In this method, you only need to have physical access to the targeted person's phone to access his or her account. You simply get the person's phone, open the Instagram app, and request for a password reset. An SMS will immediately be sent to the phone allowing you to set a new password. This method is also used to steal someone else's Instagram account forever but can still be used to hack into the account temporarily. If you can access your victim's phone, email account, or Facebook account, you can easily request a password reset from Instagram and hack the account instantly.

If you can already create a fake Instagram login page in Method 3 above, then why not create a fake Instagram app that looks exactly like the original and collect users' data from the app? It is easy to create an Instagram clone app if you have the necessary skills or the patience and time to learn Android Application development. Once you have built your app, the remaining job is to make sure your victim downloads the fake app on their phone and uses it to log in to Instagram. Make sure the app redirects the targeted person to the real Instagram login page after you've collected their data in order to avoid raising any suspicion.
