Thread: [\\$70 Billion Leaves Bitcoin](#)

Fr3d - March 31, 2026, 3:40 am

When digging up Bitcoin eats your cash daily, a switch makes sense, try chasing profits elsewhere instead.

Big Shifts are happening in crypto mining, with more than 70 billion dollars now tied up in AI and super fast computing deals. These aren't minor add-ons. Entire companies are being rebuilt from the ground up. Think massive change, not tweaks at the edges.

CoreWeave's deal with Core Scientific alone? \$10.2 billion over 12 years.

TeraWulf? \$12.8 billion in contracted HPC revenue.

Hut 8? A 15-year, \$7 billion AI data center lease.

And the wildest one, Bitfarms CEO Ben Gagnon said flat out "We are no longer a Bitcoin company." A single line like that deserves to sit inside a time capsule.

By late 2026, income from artificial intelligence might make up most of what public mining firms earn, around 70% according to CoinShares. Right now, it's about 30.

That shift isn't small. What we're seeing now? Firms built around Bitcoin are vanishing. Instead, operations where AI drives the core business are taking over. The balance has already changed.

Only Stanley is permitted to post AI slop here. The question-and-answer format is a giveaway.

Anyway, my only thought is that it must take significant retooling to switch from ASICs to TPUs/NPUs/GPUs.

Idk what's worse, AI or plagiarism, but OP just ripped his post word for word from here:
